peak of PISN rate at
$Z \sim 10^{-3} - 10^{-2}$

→ Pop II stars main PISN progenitors, not Pop III

CAVEAT: SFRD and IMF at high z highly uncertain

Conclusions

strong dependence on stellar and galactic variations → PISN rate down to $\sim 10^{-4}/\mathrm{yr\ Gpc}^3 \quad (z=0)$

↓

intrinsically few

Conclusions

strong dependence on
stellar and galactic variations

→ PISN rate down to $\sim 10^{-4}/\mathrm{yr\ Gpc}^3 \quad (z = 0)$

↓

intrinsically few

possible (or lack of) future PISN observations could pose constraints on

→

- maximum stellar Z to have PISN
- upper limit of stellar IMF
- dispersion of galaxy Z distribution in z

PISN contribution from binaries similar to single stars

PISN contribution from binaries similar to single stars

main contribution to PISN rate from $Z \sim 10^{-3} - 10^{-2}$

→ Pop II stars main PISN progenitors, not Pop III

PISN contribution from binaries similar to single stars

main contribution to PISN rate from $Z \sim 10^{-3} - 10^{-2}$

→ Pop II stars main PISN progenitors, not Pop III

single galaxy ($M_\star$, Z , ψ , z) contribution to PISN rate

↓

possible indications to future observational campaigns from host galaxy properties

Follow-up

where are the PISNe?

intrinsically few

observational issues

PISN detection rate with JWST

Back-up slides

Possible reasons for missed observation

assuming theory of stellar evolution is correct

PISNe only at high z (low Z environments) → too dim to be observed

stellar Initial Mass Function (IMF) does not extend up to PISN range

stars with mass > 300 $M_\odot$ observed (stellar mergers?)

PISNe preferentially in dusty environments → emission blocked by dust

PISNe more rare than CCSNe

PISN emission

early times

conversion of kinetic and radiation energy into thermal energy

later times

large amounts of radioactive ^{56}Ni up to $\sim 60\ M_\odot$

near-infrared band

expected PISN luminosity

$$L_{PISN} \lesssim 10^{44}\ erg/s$$

typical luminosity of Core-Collapse Supernovae (CCSNe) routinely observed in Local Universe

$$L_{CCSN} \sim 10^{42}\ erg/s$$
